$$3. \begin{bmatrix} 1 & -2\alpha & 1 \\ 2\alpha & -1 & 1 \end{bmatrix}$$

$$-2\alpha r_1 = -2\alpha, 4\alpha^2 - 2\alpha$$

$$\begin{bmatrix} 1 & -2\alpha & 1 \\ 0 & -1+4\alpha^2 & -2\alpha \end{bmatrix}$$

$$(-1+4\alpha^2)x_2 = -2\alpha$$

If $-1+4\alpha^2 = 0$ and $-2\alpha \neq 0$, then no solution.
 $4\alpha^2 = 1$

$$\alpha^2 = \frac{1}{4} \quad \alpha = \frac{1}{2} \Rightarrow -2\left(\frac{1}{2}\right) \neq 0$$

$$\alpha = \pm \frac{1}{2} \quad \alpha = -\frac{1}{2} \Rightarrow -2\left(-\frac{1}{2}\right) \neq 0.$$

If $\alpha = \pm \frac{1}{2}$, no solution.

Infinite solutions if $-1+4\alpha^2 = 0$ and $-2\alpha = 0$.

α must be 0 for $-2\alpha = 0$

$$-1+4(0)^2 = -1, \text{ so this is impossible.}$$

the system will never have infinite solutions.

Unique solution for all other α .

$$(-1+4\alpha^2)x_2 = -2\alpha$$

$$x_2 = \frac{-2\alpha}{-1+4\alpha^2}$$

$$x_1 - 2\alpha x_2 = 1$$

$$x_1 - 2\alpha \left(\frac{-2\alpha}{-1+4\alpha^2} \right) = 1$$

$$x_1 + \frac{4\alpha^2}{-1+4\alpha^2} = 1$$

$$x_1 = 1 - \frac{4\alpha^2}{-1+4\alpha^2}$$

In conclusion, if $\alpha = \pm \frac{1}{2}$, the system has no solution.

Otherwise, the solution is $x_1 = 1 - \frac{4\alpha^2}{-1+4\alpha^2}$,

$$x_2 = \frac{-2\alpha}{-1+4\alpha^2}.$$
